December, 2011

P R E F A C E

The assessment of field situation of wet season agriculture in Nigeria is an annual exercise. This year, it was jointly conducted in September 2011 by the National Agricultural Extension and Research Liaison Services (NAERLS), National Programme on Agriculture and Food Security (NPAFS), National Bureau of Statistics (NBS), Federal Department of Fisheries (FDF), Nigeria Meteorological Agency (NIMET), Planning, Policy, Analysis and Statistics Department (PPAS), Federal Department of Agriculture (FDA), Federal Livestock Department (FLD), National Productivity Centre (NPC) and the five Zonal Coordinating Research Institutes. Eighteen teams of three specialists each covered all the 36 states of Nigeria and the Federal Capital Territory (FCT) involving 148 LGAs across the country.

We wish to express our sincere appreciation to officials of the Ministries of Agriculture, State Agricultural Development Projects (ADPs), other State parastatals and LGA officials across the country that made all the necessary arrangements to facilitate the smooth conduct of the study and also provided the required data. The outputs of the evaluation exercise have been put together into an executive summary, state and national reports, which are being circulated to all states and relevant Federal agencies and other stakeholders. This executive summary is the first in the series of reports of the assessment of the 2011 wet season providing principal trends and findings that can guide decision-makers and researchers. The continued involvement of agencies such as NBS, NPC, FDF and NIMET has raised the scope and enriched the reports. Concerted efforts are being made to improve the capacity of all participating agencies in data collection and management. Comments on the executive summary are welcome.

EXECUTIVE SUMMARY

The Wet Season Agricultural Performance Survey (APS) for this year was conducted between 4th and 14th September, 2011. The survey was jointly carried out by the National Agricultural Extension and Research Liaison Services (NAERLS) and the National Programme for Agriculture and Food Security (NPAFS) in collaboration with

The objectives of the survey were to assess the agricultural performance of 2011 wet season, make production forecasts for the season; identify constraints to increased agricultural productivity and effective extension delivery service; and to provide feedbacks for improved research and policy performance.

several other stakeholders in agricultural data generation and use. The agencies include the National Bureau of Statistics (NBS), Federal Department of Agriculture (FDA), Nigerian Meteorological Agency (NIMET), Planning, Policy Analysis and Statistics Department (PPASD), Federal Department of Fisheries (FDF), Federal Livestock Department (FLD), National Productivity Center (NPC) and the five Zonal Coordinating Research Institutes (IAR, LCRI, NCRI, IAR & T and NRCRI). The widened scope of participation has been maintained to sustain improvement in the quality, utility and depth of the data generated from the survey. The objectives of the survey were to: assess the agricultural performance during the wet season; make production forecasts; identify constraints to increased agricultural productivity and effective extension delivery service; and provide feedbacks for improved research and policy performance.

Eighteen multi-disciplinary teams of three scientists each carried out the exercise across the states and FCT using Participatory Rural Appraisal (PRA) techniques. This involved the use of structured questionnaire/ checklists, farm visits, interviews with farmers and Ministry/ADP officials. In every state, two communities each were selected from two LGAs in each of two selected agricultural zones for evaluation. From each community, five farmers were interviewed in addition to focused group discussions held at every site. A total of 54 scientists were involved in the survey. Final wrap-up sessions to validate data generated were held at the end of each state visited with officials of the state ADPs and Ministries of Agriculture. It should be noted that the crop production figures use in this report are adjusted based on 2010 forecast while those of the current year 2011 are forecast. The summary of the findings of the survey are presented as follows.

Rainfall Situation

The rainfall situation in 2011 was substantially similar to that of 2010. The rains started in between April and May in the North-East and North-West Zones. Most of the states in the North-Central and South-West Zones had their first rains in January except Plateau and Taraba states that had their first rain in February. Heavy down pours occurred across the country but in different months. Heavy rains that resulted in floods occurred this year in Oyo, Ondo, Lagos Sokoto, Kano, Jigawa and Adamawa states causing severe crop damages and casualties.

There was a more even rain distribution across the country in June, July and August than for the corresponding period in 2010 except that dry spells also occurred in Bauchi, Katsina, Kwara and Gombe which affected maize, sorghum and cassava. Ekiti and Edo states had more rains this year than in 2010 while Oyo, Osun, Ondo, Ogun and Lagos had less this year relative to corresponding periods in 2010. The trends of rainfall in Delta state were similar in the two years. In the South-East Agro-ecological zone rainfall this year was generally higher than in 2010. There are indications that the rainy season will be extended which has potential to damage early planted crop especially as effective grain dry options beside sun drying are not available.

Agricultural Mechanization

Agricultural production in the country still relies mostly on manual labour. A total of 8 states and the FCT did not provide any data on availability of tractors. This paucity of information is worrisome as it makes proper planning for tractorization virtually impossible. The data available showed that

the number of functional tractors for farm operations decreased from 2,117 in 2010 to 1,579 in 2011. Similarly, the number of non-functional tractors increased from 876 to 1,004 within the same period. Information on privately owned tractors was not readily available as only 5 states – Bauchi, Kebbi, Nassarawa, Benue and Bayelsa provided data. The increase in the number of non-functional tractors between 2010 and 2011 also reflects the a worrisome trend of closure of tractor maintenance and servicing workshops across the country. Related to this is the gradual disappearance of functional Tractor Hiring Units in many states. The average price charged for

farm operations (N12, 000 to N15, 000 per tillage operation) showed an increase beyond that for 2010 (N8000 - N9, 000) which is putting the patronage of this services beyond farmers' reach.

Frequent breakdowns, scarcity of genuine spare parts, poor maintenance practices and high running costs and lack of reliable tractor operators remain the major problems farmers listed.

In Borno, Zamfara and Kano states, however,

20-25% increases in the adoption in work bulls were reported.

Plate 1: Sprayer for pest control

Use of Improved Farm Inputs

During the year, many states procured and distributed planting materials for major cereals, legumes, tree crops and solanaceous crops. The commitment shown by the states in the amounts released for the procurement was, however, inadequate, as most of the planting materials were insufficient. The materials were only slightly considered affordable by farmers and there were limited reports of questionable viability. Sources of planting materials remained the National Agricultural Seed Council, Seed Companies and Research Institutes. Many states did not put sufficient efforts on the procurement and distribution of cash crops, such as groundnuts, ginger, sesame, cocoa, oil palm, rubber, etc.

In addition to seeds and other planting materials, some quantities of agro-chemicals (herbicides, pesticides, fungicides and insecticides); agricultural equipment, such as tractors, storage bins, sprayers, water pumps, work-bulls and agro-processing equipment like rice huller were procured and sold to farmers. Though the demand for boom sprayers increased during the year under review, their prohibitive cost and unavailability hindered widespread usage. In Yobe, Plateau, Kogi, Benue, Ogun, Delta, Anambra and the FCT some farm inputs and agro-chemicals were procured and distributed to farmers. The sources of these equipment/agro-chemicals included various agro-chemical companies, ADPs, NPAFS and the open market.

Most of the equipment and agro-chemicals supplied were neither adequate nor affordable to farmers in many of the states that provided information. As in others years, the impaired access to modern inputs compromised expansion of production and the prospects of increasing youth's participation in agriculture.

Fertilizer Procurement and Distribution

Fertilizer procurement data were available for most of the states, except for Gombe, Katsina, Kwara, Osun, Ondo, Lagos, Enugu, Ebonyi, Cross River and Rivers states. The data also indicated a decline in procurement and distribution in comparison with 2010. Government subsidized price per 50kg of NPK ranged from ₦1, 000 to ₦3, 500. Zamfara State distributed fertilizers to farmers at the lowest rate of ₦1, 000 per 50kg, while other states sold for between ₦2, 500 and ₦3, 500. Fertilizer distribution was grossly inadequate throughout the country, as data indicated that farmers' access to government procured fertilizers was insufficient during the year.

Labour Cost of Farm Operations

Labour costs for farming operations varied slightly during the 2011 cropping season, as compared to 2010. North-East had the lowest marginal increase of about 7%, while South-West recorded the highest increase of about 32%. The national average of labour cost record increase was 15%.

Food Commodity Prices

Comparison of market prices of major food commodities across the country were made for July 2010 and July 2011. There was an increase in the prices of maize, millet and rice in the NE, NC and the SW zones.

Adamawa state experienced about 56% increase in the price of rice despite growing rice imports (Fig 3), while in the FCT, maize and millet had 40% price increase. There was, however, decrease in the prices of maize, millet and rice in the NW and SE/SS; while Sokoto had about 23% decrease in maize prices and 36% in millet, Kano and Imo had 52% and 32% decrease in rice prices respectively and Rivers had a decrease of about 33% in the price of maize.

Increase in the price of sorghum was experienced in the NE, NC and NW, with Kaduna having the highest (52%). There was a slight decrease in the prices of cowpea in the NW, NC and SW. Stable prices was reported for cassava products in the NE while an increase was reported in the NW, with Sokoto having an increase of 27% and Oyo, 56% in gari prices. There was a sharp increase in the prices for cassava products in the SE/SS.

Ebonyi reported about 250% increase in cassava tuber price and 85% increase for cassava flour. A significant decrease in the prices of cassava products was reported in the NC, the SW and the SE/SS. Kwara reported about 63% reduction in the price of cassava tubers; 35% for gari and 48% in cassava flour. Oyo reported 69% decrease in cassava tuber price, and 30% decrease in the price of cassava flour, while Ebonyi had about 36% decrease in gari prices. Sharp increases in the prices of yam tubers, flour and sweet potato were recorded in the NW, NC and SW, with Kaduna having 169% increase in yam tuber price and 158% for sweet potato. Kwara experienced 55% increase in sweet potato price, while Oyo and Ogun had about 58% and 42% increase, respectively, for yam tubers and sweet potatoes. A significant decrease in the prices of yam tuber, yam flour and sweet potato was reported in Niger (50-61%), Ondo (35-40%), Abia and Rivers (30-33%).

A sharp increase in the price of melon was reported. The increases were 35% in Bauchi 70% in Nasarawa 89% and 81% in Osun and Ebonyi states respectively. Price increases for potatoes were more than 94% and 45% in Bauchi and Imo states respectively. Also price of soybean this year increased by more than 80% over that of 2010 in Kano, Oyo, Zamfara and Kaduna States

With regard to animal products, a slight increase in the prices of beef and goat meat was reported in the NE and NW, with Bauchi (16%), Adamawa (18%), Sokoto (13%) and Zamfara (17%). But in NC and SE, significant increases in the prices of beef and goat meet were reported with Kwara (78%), Cross Rivers (97%) and Rivers (136%). No data for pork prices were received from all the zones. Sokoto and Niger reported an increase of 71% and 78% respectively in the price of mutton. Kwara indicated 30% increase in chicken prices, Cross Rivers 41% and Oyo and Ondo reported more than 20%. Bauchi however, reported a 56% reduction in the prices of chickens. Marginal increases in the prices of eggs were reported in Bauchi (32%), Kaduna (28%) and Benue (26%). Taraba and Cross River reported an increase of 42% and 425% respectively in fresh fish prices. Very high increases were experienced in the

prices of both smoked and dried fish with Rivers (433%), Cross Rivers (261%) and Bauchi (76%). In general, significant price increases occurred in markets in all zones for major agricultural commodities.

Crop area estimates

The area devoted to production of maize increased slightly from 5.06 million hectares in 2010 to 5.153million in 2011. The land area under yam and cowpea cultivation remained substantially unchanged at 4.26 million hectares, 3.2million hectares respectively. That of sorghum decreased slightly from

5.04million hectares to 4.89million hectare. Rice area increased from 2.55million hectares to 4.57 million hectare during the same period. Production area for millet and soybean however decreased slightly. Also cotton area decreased again this year for the sixth time in a row.

Production Estimates

Figures 4-6 show the output trend of major crops in Nigeria from 2002 to 2011. The output forecast this year for maize is 9.38 million tons compared with 9.0million tons produced in 2010 which represent a 4% increase. Sorghum production will decline slightly from 7.02 to 6.89 million tons. About 4.56million tons of rice is the forecast this year which is comparable with that of last year

The estimate output for yam this year is 37.12million tons which is similar to that of 2010. Millet production is estimated to decrease from 1.38 million tons to 1.27 million tons this year. The record 52.3 million tons of cassava produced in 2010 will be raised slightly to 52.4 million tons this year.

Soybean output is anticipated to decrease slightly from 599,559 tons produced in 2010 to 564,760 tons expected in 2011. Groundnut production will increase marginally from 2.952million tons produced in 2010

to 2.963 million ton in 2011. Cotton output will however decreased from 73,097 tons in 2011.

On overall, the food situation prospect for 2011 is only slightly better than that of 2010 despite favourable rainfall situation that prevailed in 2011.

Several factors accounts for the poor growth in output figures expected in 2011 among which are poor extension services, low use of improved inputs such as seeds, poor access to credits, high cost of inputs, pests and disease attacks and incidence of floods and dry spells that occurred at different parts of the country.

Grain Reserve

The purpose of national grain reserve is to ensure an all year round availability of food and food commodity price control. However, majority of the states in the country did not have any record of stored grains and distribution for 2011.

Crops Pests and Diseases

In the 2011 cropping season, incidences of crop pests and diseases were generally light or moderate in severity across the country. In a few cases however, heavy infestations occurred. For instance quela bird attacks on rice and cereals were heavy in Gombe, Ogun, Ondo, Edo and Anambra states; stem borer and striga attacks remained severe on millet, sorghum and maize among the cereals and on cowpea and Alectra attack on ground nut occurred in NE, NC, and SE/SS. Also, blast attack on rice was heavy across the country especially South East and South South zones. Thrips attack on cowpea, was heavy in Ekiti and Kano. Also leaf spot infestation on groundnut was heavy in Adamawa and Nassarawa State while mealy bug on yam was reported heavy in Plateau. Dieback infestation on cocoa yam was heavy in the South East and South South zones and light in North West zone. Tomato wilt was especially heavy in Oyo state just as termites attack on yam and early maturing maize. Owing to delay in the cessation of rainfall, concerns for aflatoxin in many of the early maturing grain crops has arisen and may warrant implementation of elaborate control measure of which farmers are yet to learn.

Livestock and Fisheries

As in the previous years, unavailability of data still plagues the livestock and fisheries sub-sectors in Nigeria. Only twelve states provided scanty data on livestock population and fish production. In many states, production estimates for cattle, sheep, goats and poultry were not very impressive. Large populations of poultry were estimated in Abia, Ekiti, Niger and Kano. Rivers State reported the highest estimates of pig (3.6 million). In cattle production, the following diseases were reported: CBPP in Bauchi and Jigawa; FMD in Bauchi, Bayelsa, Jigawa, Kano, and Rivers states; and feed poisoning in Bayelsa, Jigawa and Kano states. Other reported disease conditions for cattle were diarrhea, kata, mange, helminthiasis and ectoparasites. The coverage of diseases that affected cattle was state wide in the affected states. Many of the stocks were vaccinated against the prevalent diseases. There were reported cases of PPR, worm infestation, pneumonia, diarrhoea, helminthiasis and chronic respiratory diseases in Kebbi, Kaduna, Niger, Kogi and Ondo respectively. It is noteworthy that Kano, Kogi, Bayelsa and Rivers states treated and vaccinated a high number of sheep and goats. Most of the farmers are practising both intensive and free range local fowls, and a few exotic birds were reared mainly by large-scale commercial farms in most of the states.

High costs of feed and medication were major constraints to farmers in the livestock industry in the country. However, a good number of birds in all the states were vaccinated to enhance production. Data for aquaculture and fisheries were largely not available in many states and even those available were scanty. Out of the 36 states and FCT, only Osun procured and distributed fisheries input, such as fishing nets, fingerlings and feeds in 2011. Many states did not procure inputs due to lack of fund in 2011. In aquaculture, major diseases experienced include bacterial, fungal, viral diseases and broken skull. Fish parasites, such as leeches, helminthes, and predators, such as dragon flies, monitor lizards, snakes and frogs were reported in Ekiti, Gombe, Bayelsa and Edo states, although, their effect was light, except in

Bauchi State where heavy infestation was reported. Pest and diseases persist in most states; this is a major challenge to fish farmers, who also lack knowledge and manpower in disease diagnosis and treatment. Poor feeding, insufficient water supply and poor management of fish stock are other challenges faced by farmers.

Agricultural Development Programme Extension Activities

Across the states, the number of VEAs and other front-line extension agents did not improve. Extension to farmers' ratios remained at record levels that are higher than 1:1800 farmers. In Bauchi, Kano, Yobe and Ebonyi states which had the highest number of VEAs of 306, 780, 265 and 257 respectively. The number of VEAs in Ebonyi state was an increase of 65% over the 2010 record. The dwindling funding of ADPs across the country might have been responsible for non-employment of additional VEAs. Anambra, Enugu and Rivers states have the highest EA : farmer ratio, with 1:9,407, 1:6,848 and 1:6,749, respectively. With respect to farm visits, Taraba State ADP recorded the highest number of visits to farmers by VEAs (150,000); while Zamfara State had the lowest record of visits of 56. The use of Management Training Plot (MTP) and On-Farm Adaptive Research (OFAR) slightly increased in a few ADPs. About 62% of the ADPs did not conduct Small Plot Adoption Technique (SPAT) for the year under review. Ekiti State conducted the highest number of SPATs (1,278), while Adamawa State had the highest number of MTPs (10,000) and Imo State, the highest number of OFAR trials (900) which it conducted under the AFDB-CBARBD Project. Kwara, Delta and Ekiti states mounted innovative OFAR and SPAT on fisheries using traditional earthen ponds.

The conduct of forth nightly training (FNT) was not a popular activity among many ADPs. For instance, about 40.5% of the states did not record any FNT for 2011. The modification of FNT to MT did not help matters. In Edo, Imo states and FCT however, almost 100% achievement of FNT targets was recorded. Similarly, only Lagos State and the FCT reported 100% achievement of MTRM targets. Many ADPs have abandoned the conduct of MTRMs owing to funding constraints.

Many states reported delay or lack of payment of counterpart fund for Key development Projects, and also complained of inadequate skilled extension personnel, lack of mobility for fieldwork, as well as the lack of incentives/motivation for extension staff.

In 2011/2012, the major training needs of the ADPs include skill improvement in areas of crop improvement, pests and disease management; agricultural project planning and monitoring; building agricultural extension communication skills of extension specialists; management of tractor operations, fish culture handling, nutrition and breeding; and agricultural produce' storage, processing and preservation and strategy for promoting public compliance to agricultural policy.

Recommendations

The following recommendations are made based on data collected, interactions with stakeholders in agriculture and observations during the field trips:

1. Traditional farm tools remained dominant in Agriculture in Nigeria and a dis-incentive for the engagement of youths. Though government had made some modest investments in the provision of tractors, lack of processing machines is constraining optimal use of the tractors and expansion of production.

In order to stimulate youth participation in agriculture and productive use of available tractors, significant investment in processing machines and cottage level processing skill development is required.

2. Inventory of agricultural machineries in Nigeria is currently lacking which makes planning for mechanization difficult.

A nationwide survey should be commissioned to document the actual needs and available tractors and machines for processing in order to guide the transformation agenda of the country.

3. Climate change is complicating the pressure on the national research system to provide novel technologies for transformation of the nations agriculture but they are beseeched by myriad of infrastructural and funding/ personnel problems.

Improved funding for research to develop appropriate technologies for mitigating the effects of climate change, multi-purpose tree species for checking soil erosion, desertification, nutrient efficient crops, control of

Plate 1: Earthen fish pond common in Nigeria

pests and diseases of crops, livestock and fisheries and low cost feeds and feeding techniques for fisheries and livestock.

4. Sustainable agricultural transformation requires active engagement of skilled extension personnel. Presently, the number of such personnel available is uncertain. Also, the number of unemployed graduates that could be mobilized to realize the transformational agenda is yet to be determined.

A national census of extension personnel and unemployed graduates should be conducted with a view to factoring their integration into agricultural value chain incubation schemes upon which the transformation agenda would be leveraged.

5. The strategic grain reserve of the federal government is currently not being complimented at the state levels.

To enhance effectiveness of the programme state governments and the private sector need to take a more active responsibility in ownership, stocking and distribution. A situation in which the operation of the strategic grain reserve scheme is almost under the exclusive control of the Federal Government is unlikely to be sustainable.

6. There is paucity of data on livestock and fisheries production across the states. There is therefore the need to initiate the conduct of livestock population census and nationwide fisheries production survey in order to enhance the reliability of livestock and fisheries data for development planning.

Plate 2: Improved cattle breed

7. Increasing production cost coupled with low producer prices is making agriculture unattractive. Provision of growth support incentives need to be enhanced and sustained using schemes that benefit the target farmers such as the improved voucher scheme.

8. Across the country, extension service institutions are weak and showing signals that they cannot anchor anticipated transformation agenda of government unless there are reforms. Central to the problem of extension service is the structure of its funding and administration. At a national level, extension services do not have a

Plate 3: A good maize stand likely to produce high yield

coordinating or supervisory supports that trickle down to all levels of governance such that there are fairly good measures of congruence towards the national food security goal. This has occasioned an extension system in disarray. In many states, provision for counterpart funding is overarching or the only provision for agriculture. Uncoordinated intervention of projects by donor agencies in many states depletes

extension personnel and the capacity of the ADPs to institutionalize statewide agricultural development. The problem is complicated by poor involvement of the Local Government Area councils in agricultural extension service.

There is an urgent need for the establishment of a Department of Agricultural Extension at the Federal Ministry of Agriculture and Rural Development to coordinate and promote active involvement of all tiers of government in agricultural extension services.

1.0 Introduction

The annual agricultural performance survey was conducted between 23rd August and 3rd September, 2010. The National Agricultural Extension and Research Liaison Service (NAERLS) and the National Programme on Agriculture and Food Security (NPAFS)/National Food Reserve Agency (NFRA) conducted the national survey in collaboration with several other agencies. The agencies include the National Bureau of Statistics (NBS), Federal Department of Agriculture (FDA), Nigerian Meteorological Agency (NIMET), Planning, Policy Analysis and Statistics Department (PPASD), Federal Department of Fisheries (FDF), Federal Livestock Department (FLD), National Productivity Center (NPC) and the five Zonal Coordinating Research Institutes (IAR, LCRI, NCRI, IAR & T and NRCRI). All these organizations contributed scientists and logistics to facilitate the conduct of the survey. The expansion in the range of participating Institutions was strategic in order to improve the depth, quality and utility of the output of the exercise.

The key objectives of the survey were to:

- Assess 2011 wet season agricultural performance and to make forecasts for the season;
- Identify constraints to increased agricultural productivity and effective extension service delivery; and
- Provide feedback for improved research and policy directive.

2.0 METHODOLOGY

A multi-disciplinary team of three scientists conducted the survey in each state using a menu of participatory techniques. Primary data were collected through questionnaires, field visits/observations and Focused Group Discussions. The team included officials of state Agricultural Development Programmes (ADPs), NIMET and Ministries of Agriculture and Natural Resources as well as individual farmers/farmers groups in 148 Local Government Areas across the country (four LGAs in two ADP zones in each state). Five farmers were interviewed in each LGA. The ADP zones and farmer groups visited were purposefully selected to reflect agro-ecological zones and farmers that are representative of the farmers in the State. Each of the thirty six states and the Federal Capital Territory (FCT) were visited for three days/state. A total of 56 scientists were involved in the survey. On the last day of the visit in each State, wrap up meetings were organized to highlight the team's observations, validate records and to improve on crop production forecasts with State officials. Each team used 2010 Cropped Area Yield Survey (CAYS) report from NPAFS, MTRM Reports as guide for the forecasts.

3.0 FINDINGS/OBSERVATIONS

3.1 WEATHER SITUATION

The comparative data for 2011 and 2010 rainfall situation in Nigeria for the five ecological zones of Nigeria is shown in the tables below:

Draft

USE OF IMPROVED FARM INPUTS

Availability and access to farm inputs are critical to improving productivity and food security. It is expected that the use of improved farm inputs in both crop and livestock/fisheries production, will enhance better growth, healthy and high quality products, increased output, better market access/prices and improved incomes and livelihoods for farmers in Nigeria. Information was collected. The data on planting materials, agro-chemicals, farm equipment and fertilizers are presented on Tables 9, 10 and 11.

PLANTING MATERIALS

During the year under review, few states made efforts to provide seeds and planting materials to farmers using established government sale/distribution outlets. The scale of distribution was grossly inadequate (Table 9). Some of the planting materials procured and distributed during the season included those of cereals (Rice, Maize, Sorghum and Millet), legumes (Cowpea and Soybean), tree crops (Citrus, Mango, Guava, Oil Palm, Cashew, Cocoa and Neem) and solanaceous crops (Tomato, Cabbage and Okro). Others included Plantain, Banana and Pineapple suckers. Varying quantities of these planting materials were procured and distributed to farmers. However, the adequacy and affordability of these materials was generally not so satisfactory. Source of planting materials included the National Agricultural Seed Council, Seed Companies and Research Institutes. It was observed that most states did not put sufficient efforts on the procurement and distribution of cash crops with great export potentials such as Groundnuts, Ginger, Sesame, Cocoa, Oil Palm, Rubber, etc. Also, data on livestock and fisheries was not reflected for the period.

North East Agro-Ecological Zone

This zone basically occupies the Northern Guinea and Sudan savannas. Efforts were made by Borno, Adamawa and Bauchi states to procure and distribute various quantities of seeds. Farmers expressed their discomfort with scarcity and high cost of the inputs this year across the country especially in Adamawa and Bauchi states. In many instances, cases of fake seeds were the major concern which is discouraging adoption of improved seed. This is creating new challenges to the bid to raise the level of adoption of improved seed which is currently below 30% for improved Open pollinated varieties and about 15% for hybrids in the country. Indeed, dealing with the problem of fake and substandard seeds remained a critical strategy to increasing adoption of improved seed. Data on planting materials was not available for Yobe and Gombe states. In Gombe, Bauchi, Adamawa States however, many farmers reported receiving drought tolerant seeds under a "seed dropped scheme" of Community Based- Rural Development (CBARD) Project for the first time since the inception of the Project five years ago. The provision of seeds to non-target communities under the scheme by the project was applauded by the farmers and raised scope for realizing the objectives of the CBARD Project.

North West Agro-Ecological Zone

The zone has Southern Guinea Savannah (SGS), Northern Guinea Savannah (NGS) and Sudan Savannah (SS) ecologies. Data on state involvement in seed procurement and distribution were not available for Zamfara, Katsina and Kano states. However, Kaduna, Sokoto and Kebbi states procured and distributed some planting materials which again were grossly inadequate leading to affordability problem. Cases of fake seeds were reported in, Kaduna and

Kano States which incidentally are the states were the level of adoption of improved seeds is high.

North Central Agro-Ecological Zone

This zone lies within the Guinea Savanna (northern and southern). All the states, except Niger and Benue, managed to procure and distribute some quantities of planting materials to farmers. Farmers reported that most of the materials were generally neither inadequate not affordable. As in the North West Agro-ecological zone, incidence of fake seeds was also rampant especially in Nasarawa and Plateau States.

South West Agro-Ecological Zone

This zone is found within the Forest and Rain forest areas of Nigeria. Most of the states in this zone supplied planting materials to farmers except Oyo state where data was not available. However, the materials were not adequate. There were instances in which some the improved planting materials were supplied free of charge under some special projects which tended to stimulate demand for the planting materials that could not be met.

South East Agro-Ecological Zone

South East Agro-Ecological Zone is also found within the Forest belt and mangrove swamp in the costal plains. Except for Bayelsa state, all the states in the zone supplied various quantities of seeds to farmers. The seed materials were generally not adequate but farmers' considere their prices at government sources affordable.

AGRO-CHEMICAL AND SOME FARM EQUIPMENT

Table 10 presents data on the procurement and distribution of agro-chemicals/farm equipment across the country within the 2011 wet season. Agro-chemicals procured and distributed by state governments were herbicides, fungicides and insecticides; while the agricultural equipments included Tractors, storage bins, sprayers, water pumps, work bulls and agro-processing equipment like Rice Huller. In many instances, provision of inputs to farmers was restricted to NPAFS & Fadama Prject sites and Commercial Agriculture Project communities.

Thirteen (13) states including Gombe, Katsina, Kano, Adamawa, Taraba, Ekiti, Lagos, Edo, Imo, Bayelsa, Rivers, Cross Rivers and Ebonyi did not supply data on the status of agro-chemical/farm equipment procurement in 2011. However, states like Yobe, Plateau, Kogi, Benue, Ogun, Delta, Anambra and the FCT were able to procure and distribute a little quantity of agrochemicals, farm equipment to farmers. While States like Borno, Bauchi, Kebbi, Kaduna, Niger, Kwara, Oyo, Osun, Ondo, Enugu, Akwa Ibom and Abia procured and distributed only

agro-chemicals to farmers within the period. In many states especially in southern states, tractors procured for farmers remained un-distributed and being overshadowed by weeds. Farmers reported that because most of the tractors are new brands which may warrant spares problems and difficulties in finding competent repairers accounts for lack of patronages of government tractors. The sources for the supply these equipments/agro-chemicals included various agro-chemical companies, ADPs/MANR, NPFS. Majority of farmers obtained their pesticides and farm machines from open markets at prohibitive costs. This implies that farmers did not experience any favourable operating environment with regard to the availability and affordability of inputs in 2011 wet season as in 2010.

FERTILIZER PROCUREMENT AND DISTRIBUTION

Available report on fertilizers procured and distributed within the agro-ecological zones of Nigeria in year 2011 is presented on Table 11. Many states supplied fertilizer procurement and distribution figures except in Gombe, Katsina, Kwara, Osun, Ondo, Lagos, Enugu, Ebonyi, Cross River and Rivers States. The data indicated a sharp decline in procurement and distribution of fertilizer in 2011 compared with 2010. In the North-East Agro-Ecological Zone, only Adamawa State procured and distributed the three grades of fertilizer; NPK, Urea and SSP. Kaduna in North-West and Benue in North Central Agro- Ecological zones procured and distributed the three grades of fertilizer while in the South-East Agro- Ecological zone, only five states also, (Ebonyi, Cross River, Akwa Ibom, Anambara, and Bayelsa) procured and distribute the three fertilizer grades. Subsidized price of 50 kg bag of NPK ranged from N2500 to N3500. Zamfara State distributed fertilizers to farmers at the lowest rate of N2500 per 50 kg bag. Fertilizer distribution was grossly inadequate throughout the country as discussions with farmers across the country indicated that farmers' access to government procured fertilizers was lower in 2011 than in 2010 which probably impacted in the level of usage. It would seem, political activities and elections that held in 2011 negatively impacted in government resolve to increase access to agricultural production inputs reflecting a shift in priorities.

CROPS PESTS, DISEASES AND NATURAL HAZARDS

The incidence of pests, diseases and natural hazards on various crops across the country as reported during 2011 wet season are showed in Table 11. The results indicated that pests and

diseases varied in severity among the affected crops in the states covered. The major crop pest infestation reported on cereal crops were stem borer (34 – 60%) which was more prevalent on maize compared to other cereals such as sorghum, millet and rice. Striga and queala birds affected all cereals in Adamawa,

FCT and Nasarawa states and their severity were moderate to light. Data obtained revealed that maize in storage were attacked by weevils in FCT, army worm in Adamawa and FCT, termites on maize in Oyo State, rodent on rice in Anambra State, mealy bug on rice in Rivers State, millipede on sorghum in Adamawa State, splittle bug on sorghum in Zamfara and Bauchi States. While the major diseases on cereals recorded across the southern states were downey mildew (23-54 %) in maize, millet and sorghum, aflatoxin in maixe (12.8%), blasts (34-80 %) on rice, leaf spots (15 %) on rice, and smuts (5-45 %) on sorghum and millet which was severe.

The major diseases of legumes reported were blight (44%), mosaic (40%), black pod (22%), rosette (12-55%), leaf spot (40%), and anthracnose (8-44%) while the prevalent insect pests of legumes were aphids (45%), pod borer (25%), weevils (33%), thrips (80%), grasshopper (23%), bug (34%), nematode (20%) and millipedes (43%). In terms of severity, the effects of anthracnose on cowpea and soybean were moderate in Lagos, Ogun and Adamawa while it was heavy in Taraba

and Plateau States. The blight disease affected cowpea in FCT while mosaic on groundnut in

Taraba state were reported which were moderately in Kogi state. The light to moderate infestation of aphids on cowpea and groundnut occurred in Adamawa, Bauchi, Ekiti, Kebbi, Taraba, Kano and Zamfara states. The heavy incidence of pod borer on cowpea, weevils on cowpea and soybean, and light attack of nematode and millipides on groundnut in FCT were reported. Grass hopper attack on cowpea in Adamawa State but was light in severity.

The major pests of root and tuber crop that were reported in the 2011 wet season report were beetle on yam recorded in Ekiti, FCT, Oyo Taraba, Plateau, Akwa Ibom states and Rivers states where the severity was moderate. Cassava root rot was also reported in a number of states like Edo, Lagos, Akwa Ibom, Cross Rivers and Anambra states where all the infestation were light while it was moderate in River state. Yam tuber rot was occurred in Kogi, Taraba and Rivers states while cocoyam rot was moderate in severe in FCT, Ekiti Cross River and Anambra States. The cassava mosaic, cocoyam and yam leaf curl was moderate in Bauchi and Kebbi, Kano and Enugu and in Kogi states, respectively. The results indicated that leaf blight infestation on cassava and cocoyam was light in Ekiti, Plateau, Rivers, Kaduna and Anambra states, mealy bug on yam was heavy in Plateau state while die back and termites were heavy on cocoyam in Cross River, Abia and Ekiti states. The wilt and fruits drop and early wilt were severe in tomato and pepper. In Oyo State incidence of tomato wilt was heavy this year as in 2010 wet season. The Sigatoka on plantain was light in Delta state unlike in 2010 when it was heavy. The incidence of beetle on ginger was moderate in FCT. The degree of leaf spot infestation on beniseed which was moderate was reported only in Kano and Jagawa.

The natural hazards that occurred in 2011 were mainly flood and dry spell. Flood that affected maize, cocoyam and rice were heavy in the following states; Adamawa, Bauchi, Plateau and Lagos; Rivers, Cross River and Ikwa Ibom; Ogun, Cross River and FCT states, respectively, moderate on yam in Lagos, Akwa Ibom, and Cross River. The effect of floods was light on sorghum in FCT, on cassava in Akwa Ibon and Cross River states. On the other hand, dry spell hazard was reported to have affected maize, sorghum, soybean, groundnut, cassava, rice and cocoyam in some states. The effect of dry spells was severe in Gombe, Adamawa, Kwara, Ekiti and Lagos states. The crops affected were Soybean, sorghum, gorund nut, cocoyam and maize in FCT, Adamawa, Zamfara, Gombe and Kaduna states as well as rice and cassava in Lagos.

Table 11: Incidence of Pests, Diseases and Hazards on Crops in 2011

Infested/affected	Pests/ Diseases/Hazard	Affected State	Severity	Control measure(s)undertaken
Maize	Army worms	Adamawa, FCT,	moderate	Chemical
Maize	Stem borer	Adamawa, Plateau, Kogi, Ondo, Rivers, Cross River, Akwa Ibom, Zamfara, Benue, Bauchi, Anambra, Imo, Enugu, Kano, Abia	Moderate	Chemical, improve variety

Benni seed	Leaf spot	Kano , Jigawa	Moderate , Heavy	Chemical

Agricultural Mechanization

Tractor is a critical input for agricultural mechanization and a major indicator for assessing level of agricultural development for a country. FAO recommended 0.2 Hp/ha tractorization density level for developing countries while developed countries have 1.2 Hp/ha. In Nigeria, data of tractor availability and condition is very scanty. In 2010, 8 out of

36 states and Federal capital did not give data on tractor availability. Available data show that about 28 states and FCT had a total of 2,117 functional tractors in 2010 that dropped to 1,579 in 2011. The non functional tractors for the states were 876 and 1004 in 2010 and 2011, respectively. Record for the privately owned tractors was 1,426 and 618 for 2010 and 2011. Fig. 1 shows trend of number of functional tractors per zone for 2010 and 2011 available at government agencies. North West topped the zones with 1218 and 525 tractors in 2010 and 2011, respectively.

North east followed the North West while North Central had the least number of the tractors. Across the states, Kebbi was reported to have the highest number of government owned tractors with 735 numbers of tractors in 2010 followed by

Borno with 370 tractors in 2011. As for the privately owned tractors, more than 70 % of the states did not present any information on tractors availability and functionality. Only five states supplied information on privately owned tractors in 2010 and 2011; they were Bauchi, Kebbi, Nasarawa, Benue and Bayelasa. Table 1 shows the number of tractors owned by government and private individuals/organizations as obtained from the records of the states ministries of

agriculture throughout the country. This inadequate information on agricultural machineries owned by private sectors and government at various levels is worrisome because it complicates planning for mechanization of agriculture in the country.

The cost of various tractor supported operations is a key factor for farmer in adopting the use of tractors or other alternatives such as animal traction or direct human labour in a similar fashion the masses are relying on fuel wood for domestic energy. Because of low number of tractors the price of tractor operation has

skyrocketed beyond the reach of most farmers. Fig. 2, 3 and 4 show the Zonal average price for Ploughing, Harrowing and Ridging across the Zones.

The price in the North East for Harrowing, Ploughing and Ridging was N15,000 per ha. This price was found to high compared to other states.

The Zonal prices for South East were N8, 957 and N11,900 per ha in 2011. However, the price fluctuates depending on the price of fuel, which was very unstable during the 2011 season. The cost of using tractor for farm operation in Nigeria is significantly high compared to other countries within the region.

Some of the problems identified affecting tractor availability and functionality were high cost of purchasing new tractors, Low quality/scarcity of spare parts, and adulteration of fuel and frequent breakdown of the tractors as well as low skill for the operators (lack of skill tractor operators and mechanics).

Although the use of animal traction can reduce the dependence on tractors and human labour, data on these are not readily available. Only three States Borno, Zamfara and Kano had reports on animal traction. Work bulls remained the preferred animal power in 2011. Number of animals used in Borno in 2010 and 2011 were 2,000 and 2,500 respectively which represented an increase of 25%. Zamfara State also had 25% increase in number of animals used for agriculture between 2010 and 2011 that is 120,000 in 2010 and 150,000 in 2011. Kano reported 10,000 number of animals used in 2010 and 12,000 in 2011 representing an increase of 20%.

Some of the problems that affected agricultural mechanization in Nigeria during 2011 are:

- 1) Lack of funds to procure spare parts to ensure continual maintenance of existing machines.
- 2) Low level of private sectors participation in THS in States.
- 3) Lack of an effective monitoring plan for tractor use and management haulage.
- 4) Shortage of field agricultural Engineers.
- 5) Shortage of certified tractor drivers/operators.
- 6) Delay in release of fund to carry out regular maintenance of tractors.
- 7) Scattered farm holdings on small hectarages (i.e. non-contiguous farmland).
- 8) Inadequate agricultural land clearing and farm road support.
- 9) Lack of training of tractor mechanics and operators.

- 10) Most of the tractors purchased by the States governments are different from the traditional types that farmers and operators are used to without prior idea in the use of new ones.
- 11) Lack of proper maintenance facilities.
- 12) Lack and high cost of spare parts, as well as high cost of fuel and lubricants.
- 13) Insufficient skill in crops water management.
- 14) Need of appropriate tube wells and borer technology.
- 15) Soil and water quality analysis.
- 16) Method and equipments for irrigating crops.
- 17) Improved and cost effective irrigation methods.
- 18) Irrigation scheduling.
- 19) Management of irrigated soils.
- 20) General cost reduction on irrigation works in plantation.
- 21) Procurement of irrigation pumps at low price.
- 22) Training on the use of small irrigation techniques and equipments.
- 23) Water requirement for commonly propagated vegetables.

Farm Management

Labour cost of some farm operations

Labour cost of farm operations per hectare slightly varied during the 2011 season when compared to the 2010 season. North East agro-ecological zone recorded the lowest cost of labour on all the farming operations compared with the other agro-ecological zones as shown in [Table 3](#).

The cost of labour on land clearing from [Table 3](#) shows that North East zone recorded a marginal increase of 7% in 2011 when compared with 2010 season, while the South West zone recorded the highest increase of 32%. The national mean value increased by 15%.

The cost of labour for land clearing was averagely low in North East, North West and North Central zones when compared with the South West and South East ecological zones because the former zones have relatively plain surfaces and the nature of the vegetation is characterised by short grasses and shrubs while in the later have more trees and tall grasses, which make it inaccessible and land operations very hard and costly.

Ploughing and ridging are two operations that are sometimes carried out simultaneously or in some zone only one of the operations is carried out in order to reduce the cost of labour. The cost of labour for ploughing and ridging marginally increased in 2011 by 10% and 7% respectively in the North East agro-ecological zone, 14% and 13% in North West zone, 9% and 8% in North Central zone, 7% and 3% in South West zone and 11% and 7% in the South East zone. North East zone recorded the lowest cost of ploughing and ridging with an average of ₦5500 and ₦5300 per hectare respectively when compared with the other zones. The highest cost of labour for ploughing of ₦40,000 per hectare was recorded in Plateau and Anambra states as shown in [Table 3](#). While Ogun state recorded the highest cost of labour in ridging operation (₦75,000 per hectare) in 2011 season.

Planting operation cost recorded a marginal increase of 13%, 11%, 6%, 7%, and 8% in North East, North West, North Central, South West and South East zones respectively in 2011 when compared with 2010 session. The national average cost was ₦9,986 per hectare.

Fertilizer application cost recorded an increase of 9% in North East, North Central and South East zones, while North West and South West zones recorded an increase of 13%, 6% respectively.

The cost of Crop Spraying operation per hectare in 2011 session was relatively low in all the zones when compare with other operations. Delta state recorded the highest cost of ₦ 10000 per hectare while Taraba, Lagos, Anambra, Imo and Abia recorded the lowest cost (₦1000 per hectare).The nation mean value for harvesting operation cost per hectare was ₦17,801 for 2011 session and the mean difference between 2011 and 2010 sessions was 6%.

Cost of Production of Major crops

The production cost of major crops increased significantly as can be seen from the Tables 2 to 9. The cost of production for a hectare of sorghum increased noticeably in 2011 over that of 2010 by about 29% and over 27% in Jigawa and Niger States respectively, but decreased by about -3% in Nasarawa State. This may probably be as a result of availability of subsidized production inputs in Nasarawa State. Production cost of Maize decreased by over -88% in Plateau State but increased by 39% in Kebbi State. Increasing domestic rice demand is inducing an increase in domestic rice production cost in States like Bauchi (16.6%), Kebbi (27.1%) and Jigawa (26.7%) while in Nasarawa State the production cost for rice did not vary remarkably in 2011 compared with 2010. An increase of about 14% in the cost of production was observed

for cassava in Edo State, compared with observed reduction in the cost by -4% recorded in Nasarawa State. Production cost of yam, cocoyam, groundnut and soybeans increased sharply with overall national means of 27%, 17%, 4%, 6% respectively.

As shown on the tables, there were serious changes that cropped up in levels of the production cost of major crops among

the States and within zones between the two years under reference. These wide variations might be attributed to relative scarcity and price differences of the inputs across the five agro-ecological zones which were so pronounced in 2011 when compared with 2010.

Among the factors accounting for the increasing cost of production are scarcity of manual labour and traditional to small farm holdings that limit mechanization high cost of input especially fertilizers, pesticides and labour. Farmers' accessibility and affordability to labour saving devices will greatly help in minimizing production, invariably maximizing farmers' incomes. Adulteration, high price and scarcity of inputs such as fertilizer, improved seeds, and agrochemicals for the control of disease and pests and mechanized farm implements are among the other factors that need to be resolved in order to reduce the high production cost.

GRAIN RESERVE

The aim of grain reserve is to ensure all -year round availability of food and price control. Most of the states did not have any records of grain stored and distributed in both in 2010 and 2011. In 2010, maize was the major grain stored in the following states, Kebbi, Bauchi, Kano,Oyo, and Niger. Other grains include Millet, Cowpea and Sorghum(Shown in the table below). The state appeared to know very little about the strategic grain reserve efforts in their respective states.

The price per Metric ton of maize was #32000 and #57000 in Niger and Oyo States, respectively. In Kano millet, sorghum and maize was stored in 2010 but not in 2011. In Niger, Maize, Millet, Cowpea and Sorghum were stored both in 2010 and 2011. In Oyo State only Maize was stored, distributed and sold in both 2010 and 2011 respectively. The effort of Bayelsa state government to procure 450,000 tons of maize for storage in 2010 was not sustained in 2011.

Food Commodity Prices

Comparison of market prices of major food commodities were made for Jan-July 2010 and Jan-July 2011 and presented on Table 3.8.1. No data from Gombe, Jigawa and Katsina States.

The prices of maize; millet and rice increased in the NEZ, the NCZ and the SWZ. Adamawa reported more than 56% increase in the prices of rice. The FCT reported more than 40% increase in the prices of maize and millet. There was also a decrease in the prices of maize, millet and rice in the NWZ and the SEZ between the two years under review. Sokoto reported more than 23% reduction in maize prices and more than 36% reduction in the prices of millet. Kano had more than 52% reduction in rice prices. Rivers reported a decrease of more than 33% in the prices of maize while Imo had more than 32% reduction in rice price reflecting that the increasing domestic production is impacting positively on local prices across the country. .

Increase in the prices of sorghum in the NEZ, the NCZ and the NWZ was reported. Kaduna reported more than 52% increase in sorghum price. There was also slight decrease in the prices of cowpea in the NWZ, the NCZ and the SWZ. Zamfara reported more than 20% reduction in cowpea price over the period under review.

Near stable prices for cassava products in the NEZ was reported. There was an increase in the prices for cassava products in the NWZ with Sokoto reporting an increase of more than 27% in the price of gari. There was a sharp increase in the prices for cassava products in the SWZ and SEZ. Oyo reported 56% increase in gari price. Ebonyi reported more than 250% increase in cassava tuber price and 85% increase in the price of cassava flour. A significant reduction in the prices of cassava products was reported in the NCZ, the SWZ and the SEZ. Kwara reported more than 63% reduction in the price of cassava tubers; more than 35% reduction for gari prices and more than 48% decreased in the price of cassava flour. Oyo reported 69% decrease in cassava tuber price, and 30% decrease in the price of cassava flour. Ebonyi reported more than 36% decrease in gari prices.

Sharp increase in the price of yam tubers, flour and sweet potato was recorded in the NWZ, the NCZ and the SWZ. Kaduna reported more than 169% increase in yam tuber price, with a corresponding increase of more than 158% for sweet potato. Kwara State reported more than 55% increase in sweet potato price. Oyo and Ogun States reported a significant increase of more than 58% and 42% respectively for yam tubers and sweet potatoes. A significant decrease in the prices of yam tuber, yam flour and sweet potato was reported. Niger State reported more than 61% decrease in the price of yam tuber while Ondo State reported about 40% decrease in sweet potato price. Abia and Rivers States reported about 33% reduction in yam tuber price. Imo had 34% reduction in sweet potato prices.

A sharp increase in the price of melon is reported. Bauchi reported an increase of more than 35%. Nassarawa State reported more than 70% increase in the price of melon. Osun reported 89% increase in the price of melon. Ebonyi State reported 81% increase in melon prices. Bauchi and Imo reported increases of more than 94% and 45% respectively for Irish potato. Cross River recorded 83% increase in

soybean price. In Zamfara and Kano States increases of more than 60% in prices of soybean occurred. Nassarawa reported more than 53% increase in soyabean prices

A slight increase in the price of beef and goat meat was reported in the NEZ and NWS. Bauchi State posted a 16% rise in beef price. Adamawa State had 18% increases in goat meat price, while Sokoto and Zamfara States reported price increases of 13% and 17% respectively for beef.

A significant increase in the prices of beef and goat meat were reported from the NCZ and the SEZ. Kwara State reported more than 78% increase in the price of beef. Niger indicated more than 137% increase in goat meat prices. In Cross Rivers State, 97% increase in beef price was recorded. Rivers State had 136% increases in goat meat price. No data for pork prices were received from all zones.

Sokoto and Niger reported increases of 71% and 78% respectively in the price of mutton. Kwara recorded 30% in chicken prices that was slightly lower than the 41% recorded in Cross Rivers but higher than the 20% posted by Oyo and Ondo States. Curiously, Bauchi reported a 56% reduction in the prices of chickens. Marginal increases in the prices of eggs were reported: Bauchi 32%; Kaduna 28%; and Benue 26%.

Taraba and Cross River reported an increase of 42% and 425% respectively in fresh fish prices.

Cross Rivers reported more than 261% increase in the prices of both smoked and dried fish. The prices of smoked dry fish increased by over 433% in Rivers State which were remarkably higher than the 76% increase recorded in Bauchi State.

3.9 FARMERS ASSESSMENT OF CROPPING PERFORMANCE

Farmers' assessment of cropping performance for the year 2011 was carried out with total number of 682 farmers which were individually interviewed during the survey.

Mixed cropping was generally practiced among 83.5% of the farmers interviewed while 8.8% were engaged in mixed farming; keeping livestock such as sheep and goats, poultry and swine as well as crop farms. Only 2.4% and 5.7% of the farmers interviewed were keeping cattle and engaged in fish farming and fishing respectively.

Maize cultivation increased in popularity in the drier zones of North East especially in Adamawa, Borno, Bauchi, Gombe, and

also in the North West such as, Kaduna, Sokoto, Kebbi and Zamfara States as key coping strategy against drought. In the South East, yam and cassava are planted as base crops. Intercrops such as yam/maize, cassava/melon/cowpea is common. Livestock and fisheries activities in all the states appeared still very minimal. There seems to be no serious extension effort to boost livestock/fish production. Although farm size per farmer interviewed remained small ranging between 0.7ha/farmer to 4.0ha/farmer, average grain yields for many crops are expected to increase slightly for key food crops due to good distributions of rainfall. As a result of high cost or lack of access to fertilizers and improve seeds in many states such as Edo, Rivers, Ekiti, Osun, Imo and Bayelsa, crop yield might be affected and overall improvement in average yield may not be realized this year.

Area cultivation in 2011 wet season marginally increased when compared to that of 2010 due to good distribution and enough rainfall patterns with higher output expected. Marginal increased of hectares put under cultivation were seen in yam, maize and rice while marginal productions increase in cassava, melon, rice and maize was predicted. Crop conditions in the field generally look good especially where mixed cropping is practice with leguminous crops. It was however observed that most of the incidences of pests and diseases infestation inflicted between light to moderate losses. Average grain yield of millet among the most progressive farmers is anticipated to increase from 0.44t/ha to 0.55t/ha while most millet farmers may have yield figures of more than 575kg/ha. The average yield of rice is expected to increase by 2.5% compared to 2010 while that of sorghum may increase marginally from 1.68t/ha obtained in 2010 to about 1.8t/ha and the increase in the average yield of maize to 2.05%. The yield of yam is likely to be more than

11.39t/ha while that of cassava may increase significantly from about 14t/ha to 15.25t/ha in the year 2011.

3.9.1 RAINFALL AND CROP PRODUCTION

The rains arrived early by the month of February in the South West and the South East but stabilized for meaningful agricultural activities in April. Farmers confirmed that the rains started between the months of April and May in all the states in the North East Zones, North West Zones, except Yobe and Zamfara states and the North Central Zones. Dry spells occurred throughout the northern states with varying levels that ranged between 12 and 27 days but better this year compared with 2010. A few southern states such as Ekiti, Lagos, Ogun, Osun, Oyo, and all states of the South East zone experienced scanty rainfall for 3-5 weeks between the month of February and March. In Ondo state, there was abrupt cessation of the rain which resulted in drought across the zones in the state. Flooding and crop submergence were reported to have occurred in Bauchi, Lagos, Ondo, and Oyo, states in the month of July and September. Rainfall extended into October across the country even for the drier ecological zones. Farmers predicted bumper harvest of maize, cassava, yam, sorghum, melon, rice, and cowpea.

3.9.2 FERTILIZER SOURCE/QUANTITY BOUGHT BY FARMERS

Farmers' questionnaires from 34 states (with the exception of Katsina and Plateau states) and FCT Abuja were analyzed. A total of 682 farmers responded to the questionnaires.

Table 3.9.1: Fertilizer Source/Quantity Bought by Farmers in 2011

Category of Farmers	Number of Farmers	Percentage of Farmers	Number of Bags of Fertilizer	Number of Bags Per Farmer
Farmers who bought Fertilizer	449	65.84	2694	6
Bought from Government and open Market Source	87	12.76	696	8
Bought only from Government Source	133	19.50	266	2
Bought only from Open Market	229	33.58	1145	5
Farmers that did not Purchase Fertilizer	232	34.02		
Farmers who got Fertilizer Free	1	0.15		

Source: Survey 2011

Across the country, farmers demonstrated increasing reliance on chemical fertilizers in their farm Enterprise. About 65.84% bought different grades of fertilizers they used against 34.02% that did not purchase this input this year while 19.50% (i.e. 133 of 682) of the farmers bought only from government source. A bag of fertilizer was sold at ₦1500 - ₦3,500 from the government source while in the open market; it was sold at ₦3,500 - ₦5,500. Farmers appeared to be more motivated to augment their fertilizer need when they are able to buy from government sources at a subsidized rate. The farmers that were able to procure more fertilizers from government and the open market used more fertilizers than those who bought only from the open market. Farmers that relied on the open market used up to 5bags compared with 2bags used by farmers who rely solely on government sources (Table 3.9.1). Many farmers in Nasarawa and Niger States were able to buy in excess of 4bags from Government sources; and this reflected on the average number of bags/farmer (2bags). Most of the farmers rarely had access to 1bag and in some cases, less than 1bag/farmer. Most farmers interviewed in Edo, and Lagos States were unable to buy any fertilizer from government source. Few got free fertilizer which was grossly inadequate for their farming.

3.9.2 FERTILIZER USAGE BY FARMERS

There are indications that the inorganic fertilizer was not sufficient. The distribution was untimely and inadequate. Farmers resorted to the use of organic manure and utilized a lot of it to compliment the inorganic fertilizer.

Table 3.9.2: Fertilizer usage by Farmers in 2011

Category of Farmers	Number of Farmers	Percentage of Farmers
Farmers who used Inorganic Fertilizer	333	48.83
Farmers who used Organic Fertilizer	68	9.97
Farmers who used Inorganic & Organic Fertilizer	134	19.65
Farmers that did not use Fertilizer	147	21.55

Source: Survey 2011

Farmers reported heavy investments on farm inputs and farm operations due to the lack of subsidy on the inputs by the government. Farmers who did not receive government allocation opined that the procurement of fertilizer should be of utmost priority by the government in order to reduce the scarcity of the product during the farming season. This is probably responsible for farmers'

desire for credit support. Instances where farmers do not have access to credit facilities, the cost on seeds and seedlings are circumvented by farmers depending on saved seeds which may lead to reduced average yields posited for several crops.

3.10. FARMERS PRIORITY NEEDS

Among the 682 farmers interviewed, government intervention in marketing produce to improve gate price were ranked the most critical element for sustainable agricultural growth in the country (Table 3.10.1 and Fig. 7) followed by access to credit for farm inputs procurement. Fertilizer availability all the time at moderate cost and ADP

extension services followed. Apparently, farmers desire a stronger linkage to the open market than

what currently prevails.

It was posited that improvement in value addition and development of new trade corridors for farm produce would induce fair farm gate price that can enhance farmers' income and livelihood. Dredging of water channels is the least concern of farmers interviewed perhaps because there are

substitutes such as wells dug individually by the farmers, and also the availability of streams and rivers. The study underscores the need to ensure the availability and accessibility of farmers to

inorganic fertilizer and enhance farmers' access to credit for farm inputs procurement. Constraints such as limited availability of farm infrastructure, poorly developed markets and credit delivery to the agricultural sector by the commercial banks should be properly addressed.

Table 3.10.1 Ranking of Farmers Needs from 36 States of the Federation and FCT Abuja

Farmers Priority Needs	Scores (%)	Rank
Government intervention in marketing produce to improve gate price.	92	1
Access to credit for farm inputs procurement.	86	2
Make fertilizer available all the time at moderate cost.	83	3
Revival of the ADP extension service system	76	4
Provision of good rural roads.	69	5
Government should make processing equipment affordable and available.	56	6
Make irrigation facilities/equipment available and affordable.	53	7
Provision of portable water supply	42	8
Control of HIV-AIDS/Malaria	19	9
Dredging water channels	14	10

Source: Survey 2011

Estimated Cultivated Land Area and Crop Production Estimates

As in previous years, the 2010 CAYS figures of NPAFS were the based data set used to estimate both land area cultivated and the production outputs for each crop and validated in each state. Hamonized and adjusted figures for 2010 were adopted and incremented by the appropriate percentage increase or decrease arrived at by State ADP Planning and Monitoring Unit (PMU) in order to to derive the land area cultivated (Tables: 3.11.1, 3.11.3, 3.11.5 and 3.11.7) and the production figures for each crop in 2011 (Tables 3.11.2 3.11.4, 3.11.6 and 3.11.8

Tables 3.11.1, 3.11.3, 3.11.5 and 3.11.7 show the land area devoted to the cultivation of each crop in 2010 and 2011 in the respective five agro-ecological zones and consolidated into the national figures while the even numbered tables that follow show the production outputs for each crop in 2010 and 2011.

Production Forecasts

Land Area Cultivated for various Crops

The land area devoted to the cultivation of the most of the crops increased marginally in 2011 compared with those of 2010 although the area of a few crops decreased. The land area of sorghum decreased by about -2.96% from 5.040million hectares in 2010 to 4.891 million hectares in 2011; maize area increased slightly from 5.060 million hectares to 5.154 million hectares which represent 1.85% increase that is occurring mainly in the drier ecologies owing to increased adoption of drought tolerant maize; rice area also increased slightly from 2.554 million hectares to 2.58 million hectares which is just about 1.0%; ginger area increased by 2.47% (from 47,730 hectares to 48,910 hectares), the area for yam increased by 0.27 % (4.256 million hectares to 4.267 million hectares); Cowpea area decreased slightly from 3.227 millionhectares to 3.189.95 million hectares which represent a -1.15 % reduction in 2011; groundnut area in 2011 was 2.34 million hectares as in 2010; millet area increased slightly by 0.39 % from 2.877 million hectares to 2.889 million hectares; cassava area increased by less that 5 % from 3.898 million hectares to 3.917 million hectares, cocoyam area increased by 0.72% from 475,00 hectares to 479,060 hectares , benisseed area decreased remarkably by -16.27% (from 228,720 hectares to 191,500 hectares; soybean area also decreased slightly from 609,560 hectares to 608,670 hectares; area under cotton cultivation increased by 2.51 % from 253,190 to 259,540 hectares; okro area increased by 0.72 % and tomato area increased by 0.16% in 2011.

Production outputs of Various Crops

The estimated production output figure of most crops in 2011 is expected to increase although the forecast for a few crops is marginal decreases over that of 2010. The output for sorghum is anticipated to drop by about 9.25 % from 7,600,460 metric tons in 2010 to 6,897,080 metric tons in 2011 becasue of dry spells and widespread flood that occurred in 2011. The forecast for maize output is a slight increase of 1.92 % (almost by the same magnitude of its production area) from 9,006,990 metric tons to 9,180,060 metric tons; rice production will post an increase of less than 1.0% from 4,537,800 metric tons to 4,567,290 metric tons. Huge domestic demand for rice is yet to significantly impact on local production and reprent great opportunity. The forecast for yam production is a light increase of 0.21% from 37.039 million metric tons to 37.115 million metric tons, Cassava output increased by 0.17 % from 52,316,500 to 52,403,480 metric tons which can support the wheat-cassava bread policy,; the forecasts for millet and soybean are decreases of -7.97 % (from 1.38 to 1.27 million metric tons) and -5.8% (from 599,560 to 564,760 metric tons). The reduction in soybean production in 2011 is likely to induce early scarcity and high farm gate price. The forecast for cotton production is decrease of -2.36% despite increase in its production area. Use of poor quality cotton seeds, flood and dry spells are some of the factors that contributing to the reduction in cotton output this year. Benniseed production will increase by about 0.93 % despite sharp decrease in its cultivated area. Favorable weather es[pecially late rains favour its production similar to that of cowpea. Output of groundnut is anticipated to increase slightly by 0.34 % from 2,952,790 to 2,962,770 metric tons; cocoyam output will increase by less than 0.1 % from 3,263,720 to 3,265,710 metric tons within the same period.

Estimated cultivated Land Area and Crop Production Outputs

Table 3.12.11 shows the average yields per hectare of key commodities in Nigeria in 2010 and 2011 wet season. Average yield of most of the crops were essentially the same between the two years under reference suggesting that the marginal increases in outputs were strongly related to the expansion in cultivated area. It also implies that productivity at farmers level remained low in some cases however, reduction in average yields were posted.

The low productivity will likely discourage farmers' especially new entrants because profitability of the various enterprises is compromised. Some of the principal factors that are responsible for the low average yields include reliance on poor quality seeds (farmers saved seeds), delays in supply of farm inputs especially credit, fertilizers and labour, vagaries in weather conditions (dry spells and floods occurring in the same year), pest and disease attacks of which farmers lack requisite skills for containment or control measures and poor extension service.

Maize

Maize is the most important cereals crop in Nigeria in terms of crop area and output. It is widely produced across the country following the development and introduction of early, extra-early and medium maturing varieties that are tolerant to drought, striga, Downey mildew, and nutrient efficient. It is one crop that continues to witness expansion in production area and industrial usage. Owing to advances in research, maize has become an indispensable food security as well as an industrial crop. In 2011, maize area increased slightly from 5.060 million hectares to 5.154 million hectares which represent 1.85%

increase that is occurring mainly in the drier ecologies owing to increased adoption of drought tolerant maize. The area devoted to maize production and its output depends on the availability and cost of fertilizer. In 2011, fertilizer cost was very high hence only a few farmers were able to apply recommended rates/ grades hence national average yield of maize is low (1.78tons /ha). Indeed, improvement in the average yield of maize and cultivated will continue to depend on access to fertilizer and market for maize grains. The forecast for maize output is a slight increase of 1.92 % (almost by the same magnitude of its production area) from 9,006,990 metric tons to 9,180,060 metric tons.

Sorghum

Sorghum is a major food and industrial crop. Demand from the industry for sorghum has been the

main driver for sorghum production. The land area of sorghum decreased by about - 2.96% from 5.040million hectares in 2010 to 4.891 million hectares in 2011. Strigaand bird attacks and head smut were the main challenges experience in 2011 wet season that affected the output of the crop

The output for sorghum is anticipated to drop by about 9.25 % from

7,600,460 metric tons in 2010 to 6,897,080 metric tons in 2011 because of dry spells and widespread flood that occurred in 2011.

Rice

Rice is food staple that is fast becoming a cash crop because of urbanization and changing lifestyles of Nigerians. It is one commodity for which the taste of Nigerians is being impacted upon by cheap imports. Huge annual imports of rice have become the norm rather than an exception despite the enormous production potential that abound on the country (fig 1). Many have noted that one of the reasons militating against rapid expansion in domestic production is the overriding effect of the

rice imports. A national awakening is leading to a comprehensive promotion of domestic production and improvement of the quality of local processing efforts. In 2011, rice production area increased

slightly from 2.554 million hectares to 2.58 million hectares which is just about 1.0%; Rice production will post an increase of less than 1.0% from 4,537,800 metric tons to 4,567,290 metric tons. It is anticipated that huge domestic demand for rice will significantly stimulate local production and investments on the commodity.

Millet

Millet is a major staple food for millions of Nigerians. It is a vital coping strategy crop with long history in the country. Its cultivation is mostly by small holder farmers and average yields are very low. For this reason, it is being partially displaced by other high yield input responsive crops such as maize in the drier savannah zones. In 2011, millet area increased slightly by 0.39 % from 2.877 million hectares to 2.889 million hectares. The forecasts for millet is a decrease of -7.97 % (from 1.38 to 1.27 million metric tons)

Cassava

Cassava is a high energy rich diet that has become a national staple and also fast becoming an industrial/ export commodity. It is usually processed into gari, starch, flour, pillets glucose ethanol etc. Nigeria is the largest producer of cassava even though it also has one of the lowest average cassava yields in the world. The problem of low cassava yields need to be relolved urgently in order to enhance the profitability of this crop and to encourage its export. This will require promotion of high yielding disease resistant cultivars, strong extension service to teach farmers how to optimize input use in cassava enterprises and the provission of affordable labour saving devices and processing machines. In 2011, cassava area increased by less than 0.5 % from 3.898 million hectares to 3.917 million hectares,

Cassava output increased in 2011 by 0.17 % from 52,316,500 to 52,403,480 metric tons. The current level of output can support the wheat-cassava bread policy especially as efforts are on course to increase productivity per unit area.

Cocoyam

Cocoyam is is another staple across the country though it is not widely marketed as yam or cassava. Cocoyam production area increased by 0.72% from 475,000 hectares to 479,060 hectares, Cocoyam output will increase by less than 0.1 % from 3,263,720 to 3,265,710 metric tons within the same period.

Yam

Yam is a major food staple that is fast becoming a cash crop owing to the changing lifestyle and

the demand for yam from African in foreign countries. Nigeria is the largest producer of yam but a substantial quantity of what is produced is wasted because of low value addition and poor storage technologies adopted by farmers. Almost every community in Nigeria have special recipes

with yam. Though demand is all-year round, the seasonality of yam remain an issue for researched because Nigerians love yam. The area devoted to yam production in 2011 increased by 0.27 % (4.256 million hectares to 4.267 million hectares);

The forecast for yam production is a slight increase of 0.21% from 37.039 million metric tons to 37.115 million metric tons

Cowpea

Cowpea is a national plant protein source that is produced mostly in the savannah ecologies because of disease pressure that is prevalent in the forest belt. Insect pests and recently parasitic weed attacks such as striga and alectra are serious problems in cowpea production. Though the production of cowpea is profitable the problem of pest control, low average grain yield (580 kg per hectare) and the tedious harvesting

/storage requirements discourage many potential farmers. In 2011, cowpea area decreased slightly from 3.227 million hectares to 3.189.95 million hectares which represent a -1.15 % reduction. The forecast for cowpea output is an increase of 0.47% from 1,852,040 to 1,860,780 metric tons.

Ground nut

Ground nut remain the country's legume cash crop. Huge domestic consumption has impeded its export. On daily basis, groundnut is eaten in various forms. It is a crop that is cherished by millions of people all over the world such that there can never be glut of it. In 2011, the area culcted with groundnut area was 2.342 million hectares which did not differ significantly from 2.340 million hectares cultivated in 2010. Output of groundnut this year is anticipated to increase slightly by 0.34 % from 2,952,790 to 2,962,770 metric tons;

Soybean

Soybean is aversatile legume crop. On the farmers' field and in the house, soybean benefits the farmer. It improves the nutrient status of the soil on which it is cultivated, it oil is low in cholesterol and it whole grain can be processed for both human foods and livestock feeds. The initial upsurge to process soybean for oil suffered a severe blow following the closure of some of the soybean mills. Expansion in the poultry industry has stimulated a renewed intrest in soybean because of the high quality amino-acis constituent of its grans. Despite high demand for soybean, its production area decreased slightly in 2011 from 609,560 hectares to 608,670 hectares; the forecasts for soybean

are decreases of -5.8% (from 599,560 to 564,760 metric tons). The reduction in soybean production in 2011 is likely to induce early scarcity and high farm gate price but more importantly pose serious problem for future production since the prospect exit for crushing all what had been produced without consideration for the provision of seeds for subsequent season.

Cotton

Cotton remain one of the cast crops of the drier savannah zones of the country though the need to provide food for the rapidly expanding population and poor producers prices had set the stage for dwindled interest in its production.

Recent programme of government to revitalize the cotto sector served to raise the interest of some farmers to once again try to grow the crop as could be seen in the area cultivated in 2011. Indeed, the area under cotton cultivation increased by 2.51 % from 253,190 to 259,540 hectares this year following elaborate sensitization efforts.

The forecast for cotton production is however a decrease of -2.36% despite increase in its production area. Use of poor quality cotton seeds, flood and dry spells are some of the factors that contributing to the reduction in cotton output this year. The reduction in cotton production in 2011 is likely to induce early scarcity and high farm gate price.

Beniseed

Beniseed is one of the upcoming export crops of immense potential that is grown across the country. It is eaten in various forms and used in special ceremonies. Though different varieties are grown, very strong market/consumers preferences exist which determine the variety that is cultivated. While the cream colored varieties are preferred in the international markets, the black seeded varieties are preferred in some marriage ceremonies in parts of the country.

Production area of beniseed decreased remarkably by -16.27 % from 228,720 to 191,500 hectares, although this did not affect its output. The forecast is that beniseed production will increase by about 0.93 % despite the sharp decrease in its cultivated area. Favorable weather especially late rains favoured its production this year.

Production area of beniseed decreased remarkably by -16.27 % from 228,720 to 191,500 hectares, although this did not affect its output. The forecast is that beniseed production will increase by about 0.93 % despite the sharp decrease in its cultivated area. Favorable weather especially late rains favoured its production this year.

Ginger

Ginger is one of the foremost spices of Nigeria with huge export and industrial potentials. It production is almost concentrated in the north central agro-ecologies with considerable production in the South Eastern agro-ecology. Its domestic use is growing remarkably in recent time and is driving production. Ginger production area increased by 2.47% in 2011 (from 47,730 hectares to 48,910 hectares). The forecast for ginger output is an increase of 1.78 % in 2011 over that of 2010 from 452,100 to 460,170 metric tons.

increase of 1.78 % in 2011 over that of 2010 from 452,100 to 460,170 metric tons.

Livestock

Livestock has historically constituted one of Nigeria's major economic resources in terms of livelihoods and its populations, but has remained the poor stepchild of petroleum and crop production in terms of its contribution to trade and export. The total value of livestock, based on mid 1991 market prices, is crudely estimated to be in the region of ₦60 billion; undoubtedly a major national asset, and a renewable resource worthy of sustained future development. However, some factors limit the development of the livestock sub-sector of agriculture in Nigeria. These limiting factors vary from vary from area to area, and species to species.

The most widely reported constraints to livestock production relate to: animal health care and disease control; the limited capacity of extension services; conflict between pastoralists and arable farmers; and the prevalence of theft, which deters investment. Previous years reports of Agricultural Performance Survey in Nigeria had illustrated the near absence of livestock data. This year's report is not in any form different in terms of lack of livestock data across the states of Nigeria. Recommendation had been made severally by previous Wet Season Reports for the establishment of livestock census unit that should involve the three tiers of government in Nigeria.

Livestock population

Table 5a shows livestock population and commercial farms in Nigeria. Large population of cattle, sheep and goats were reported in Bauchi, Jigawa, Kaduna, Kano, Niger and Taraba states. Large populations of poultry were estimated in Abia, Ekiti, Niger and Kano. Rivers State reported the highest estimates of pig to the tune of 3.6 millions. Large population of guinea fowl was also reported in Abia State.

Livestock diseases and pest

Livestock diseases and pest were shown on Tables 5c and 5d.

Cattle

In Cattle production, the following diseases were reported: CBPP in Bauchi, Jigawa; FMD in Bauchi, Bayelsa, Jigawa, Kano, and Rivers States; feed poisoning in Bayelsa, Jigawa and Kano States. Other reported disease conditions for cattle were diarrhea, kata, mange, helminthiasis and ectoparasites. The

spread of diseases that affected cattle were statewide in the affected States. Majority of the stocks were vaccinated against the prevalent diseases. Across the country, local abattoirs with attendant health risks remained popular with not statistics on patronage.

Sheep and goats

There are reported cases of PPR, Worm infestation, pneumonia, diarrhoea, helminthiasis and chronic respiratory disease in states like Kebbi, Kaduna, Niger, Kogi and Ondo respectively. However, it is interesting to note that Kano, Kogi, Bayelsa and Rivers treated and vaccinated high population of their sheep and goats.

Poultry

Most of the farmers are practicing both intensive and free range local fowls and very few exotic birds were reared mainly by large scale commercial farms in most of the states. Feed and Veterinary services (i.e. consultancy and drug administration) were among drawback that the farmers complain about in most of the states. Some

poultry farmers had some difficulties in enjoying veterinary services resulting to mortality due to the severity of diseases like coccidiosis and fowl typhoid cases in Kebbi state, New castle disease in Kano, chronic respiratory disease in Niger, poultry helminthiosis in Kogi, coccidiosis in Bayelsa and Rivers state. Meanwhile, it is commendable to note that greater population of these poultry in all

the states were also treated or vaccinated as it deemed necessary.

Fisheries

Data for aquaculture and fisheries were not available in most of the states and even those available are scanty; this might be due to strike action embarked upon by most the states during the survey and the inadequacy of fishery personnel to collect and collate data required on the field and poor funding.

Fisheries input

Out of the 36 states including FCT only 12 States procured and distribute fisheries and aquaculture input for 2010 while only 1 state (Osun) procured and distribute fisheries input such as fishing nets, fingerlings and feeds in 2011 (Table.1). Fishing gear and Craft were procured and distributed in 2010 by Jigawa, Kebbi, and Zamfara states under the NPSF program, aquaculture input (fingerling, drugs, pelletizer, brood stock and feeds) were procured and distributed in 2010 by Bauchi, Kaduna, Kwara, Delta, Ogun and Ebonyi States. Most of the States do not procure input due to lack of fund in 2011. The lack of procurement of fisheries inputs by almost all the states in 2011 might be due to lack of budgetary allocation for fisheries which is unhealthy for fisheries development in Nigeria.

Table: 1 Fish input Supply in 2010 and 2011

Fisheries Diseases

Aquaculture productions were affected with various diseases as reported (Table.2). These diseases include bacterial, fungal and viral diseases. Broken skull disease has a wide spread as most of the states reported.

Fish parasites such as leeches, helminthes, and predators such as dragon flies, monitor lizard, snakes and frogs were reported in Ekiti, Gombe, Bayelsa and Edo State though their effects was light except in Bauchi State where heavy infestation was reported. Pest and diseases persist in most the states; this is a major challenge to fish farmers because of lack of knowledge and manpower in the aspects of disease diagnosis and treatment. Poor feeding, insufficient water supply and poor management of fish stocked is another challenge faced by the fish farmers.

There is the urgent need to train fisheries technical staff on fish diseases prevention, diagnosis and treatment to forestall losses encountered when farmers are faced with these challenges. Fish farmers if possible should be trained on how to produce their feeds using locally available feed resources.

TABLE: 2 Fisheries Pests and Diseases Situation

Fish species	Pest/diseases	States Where Reported	Severity	Control Measures undertaken
Catfish	Bacterial infection, Birds, broken head	Ekiti ,Gombe	Low Moderate Moderate	Anti biotics
Catfish	Protozoa, helminths	Taraba	Mild Mild	
Catfish	broken head	Kaduna	Moderate

Fisheries Production Estimate

A total of 12 states presented data on artisanal fisheries output in 2011 (Table 3). This included both inland and coastal artisanal fisheries. 15 states also presented data on fisheries output which included both artisanal and aquaculture production in the year.

In 2011, a total number of 10 states presented data on fisheries output which included both Artisanal and Aquaculture productions. Five states presented data for aquaculture production and 4 others for artisanal output production. Artisanal fisheries production indicated that

Artisanal fisheries production indicated that

Problems of Extension

Problems of Extension affecting all the Geo-political Zones, include Lack of Counterpart Funding for all Agricultural Development Projects and Ministries of Agriculture, inadequate and un-qualified Extension Personnel, lack of Mobility for field work, and late arrival of planting materials. Others are natural hazards such as in-security, drought, pests and diseases. However only the following states, Rivers State, Imo State, Anambra State, Edo State, Lagos State, Ogun State, Osun State, Benue State, Ondo State, Kogi State, Kwara State, Niger State, FCT, Kaduna State, Jigawa State, Kebbi State, Adamawa State, and Bauchi State reported that the funding they received From their various State Governments were fair for the conduct of basic Extension Activities. Other problems of Extension Services as reported by 80% of all the states involves in-adequate qualified Extension Personnel, while 20% of the other problems involves lack/in-adequate serviceable vehicles for Field Staff, as well as lack of incentives/motivation for Extension Staff. Similarly Kwara State report Equally indicates lack of sufficient Laptops, Rain Coats, Rain Boots, and sprayer for Extension Services.

General Problems

The general problems observed on the field includes lack of response to questionnaires by farmers, dueto educational background and impression that Government is frustrating farmers effort, and late -Arrival of planting materials, inadequate supply of inputs such as Agro-chemicals for fish, as well as high Cost of labour. Other problems are associated with natural hazards such as Flood, Drought, Pests/Diseases.

More specifically the following are major problems needing research:

- Shortages or high costs of farm machineries with the attendant high labour costs
- High cost of production inputs that tend to discourage their optimal use with particular recourse to fertilizer
- Low uptake of new improved crop varieties due to lack of quality seeds which is heightened by the influence of adulteration
- High incidence of pesticides failure due to adulteration and poor handling of pesticides and decreasing crop yields
- Declining soil fertility
- Increasing salinity/acidity
- Infestation of *Striga hermonthica* in cereals, *Alectra* and *Striga gesnerioides* attacks on some legumes
- Flooding in some cases

SUMMARY AND CONCLUSION

The Wet Season Agricultural Performance Survey (APS) for this year was conducted between 4th and 14th September, 2011. The survey was jointly carried out by the National Agricultural Extension and Research Liaison Services (NAERLS) and the National Programme for Agriculture and Food Security (NPAFS) in collaboration with several other stakeholders in agricultural data generation and use. The objectives of the survey were to: assess the agricultural performance during the wet season; make production forecasts; identify constraints to increased agricultural productivity and effective extension delivery service; and provide feedbacks for improved research and policy performance.

Eighteen multi-disciplinary teams of three scientists each carried out the exercise across the states and FCT using Participatory Rural Appraisal (PRA) techniques. A total of 54 scientists were involved in the survey. Final wrap-up sessions to validate data generated were held at the end of each state visited with officials of the state ADPs and Ministries of Agriculture..

The result show that rainfall situation in 2011 was substantially similar to that of 2010. The rains started in between April and May in the North-East and North-West Zones. Heavy rains that resulted in floods occurred this year in Oyo, Ondo, Lagos Sokoto, Kano, Jigawa and Adamawa states causing severe crop damages and casualties.

There was a more even rain distribution across the country in June, July and August than for the corresponding period in 2010 except that dry spells also occurred in Bauchi, Katsina, Kwara and Gombe which affected maize, sorghum and cassava. Ekiti and Edo states had more rains this year than in 2010 while Oyo, Osun, Ondo, Ogun and Lagos had less this year relative to corresponding periods in 2010. The trends of rainfall in Delta state were similar in the two years. In the South-East Agro-ecological zone rainfall this year was generally higher than in 2010.

Agricultural production in the country still relies mostly on manual labour. A total of 8 states and the FCT did not provide any data on availability of tractors. This paucity of information is worrisome as it makes proper planning for tractorization virtually impossible. The data available showed that the number of functional tractors for farm operations decreased from 2,117 in 2010 to 1,579 in 2011. Similarly, the number of non-functional tractors increased from 876 to 1,004 within the same period. Information on privately owned tractors was not readily available as only 5 states – Bauchi, Kebbi, Nassarawa, Benue and Bayelsa provided data. The increase in the number of non-functional tractors between 2010 and 2011 also reflects the a worrisome trend of closure of tractor maintenance and servicing workshops across the country. Related to this is the gradual disappearance of functional Tractor Hiring Units in many states. The average price charged for farm operations (₦12, 000 to ₦15, 000 per tillage operation) showed an increase beyond that for 2010 (₦8000 - ₦9, 000) which is putting the patronage of this services beyond farmers' reach.

Frequent breakdowns, scarcity of genuine spare parts, poor maintenance practices and high running costs and lack of reliable tractor operators remain the major problems farmers listed. In Borno, Zamfara and Kano states, however, 20-25% increases in the adoption in work bulls were reported.

During the year, many states procured and distributed planting materials for major cereals, legumes, tree crops and solanaceous crops. The commitment shown by the states in the amounts released for the procurement was, however, inadequate, as most of the planting materials were insufficient. The materials were only slightly considered affordable by farmers and there were limited reports of questionable viability. Sources of planting materials remained the National Agricultural Seed Council, Seed Companies and Research Institutes. Many states did not put sufficient efforts on the procurement and distribution of cash crops, such as groundnuts, ginger, sesame, cocoa, oil palm, rubber, etc.

In addition to seeds and other planting materials, some quantities of agro-chemicals (herbicides, pesticides, fungicides and insecticides); agricultural equipment, such as tractors, storage bins, sprayers, water pumps, work-bulls and agro-processing equipment like rice huller were procured and sold to farmers. Though the demand for boom sprayers increased during the year under review, their prohibitive cost and unavailability hindered widespread usage. In Yobe, Plateau, Kogi, Benue, Ogun, Delta, Anambra and the FCT some farm inputs and agro-chemicals were procured and distributed to farmers. The sources of these equipment/agro-chemicals included various agro-chemical companies, ADPs, NPAFS and the open market.

Most of the equipment and agro-chemicals supplied were neither adequate nor affordable to farmers in many of the states that provided information. As in others years, the impaired access to modern inputs compromised expansion of production and the prospects of increasing youth's participation in agriculture.

Fertilizer procurement data were available for most of the states, except for Gombe, Katsina, Kwara, Osun, Ondo, Lagos, Enugu, Ebonyi, Cross River and Rivers states. The data also indicated a decline in procurement and distribution in comparison with 2010. Government subsidized price per 50kg of NPK ranged from ₦1, 000 to ₦3, 500. Zamfara State distributed fertilizers to farmers at the lowest rate of ₦1, 000 per 50kg, while other states sold for between ₦2, 500 and ₦3, 500. Fertilizer distribution was grossly inadequate throughout the country, as data indicated that farmers' access to government procured fertilizers was insufficient during the year.

Labour costs for farming operations varied slightly during the 2011 cropping season, as compared to 2010. North-East had the lowest marginal increase of about 7%, while South-West recorded the highest increase of about 32%. The national average of labour cost record increase was 15%.

Comparison of market prices of major food commodities across the country were made for July 2010 and July 2011. There was an increase in the prices of maize, millet and rice in the NE, NC and the SW zones. Adamawa state experienced about 56% increase in the price of rice despite growing rice imports (Fig 3), while in the FCT, maize and millet had 40% price increase. There was, however, decrease in the prices of maize, millet and rice in the NW and SE/SS; while Sokoto had about 23% decrease in maize prices and 36% in millet, Kano and Imo had 52% and 32% decrease in rice prices respectively and Rivers had a decrease of about 33% in the price of maize.

Increase in the price of sorghum was experienced in the NE, NC and NW, with Kaduna having the highest (52%). There was a slight decrease in the prices of cowpea in the NW, NC and SW. Stable prices was reported for cassava products in the NE while an increase was reported in the NW, with Sokoto having an increase of 27% and Oyo, 56% in gari prices. Kwara reported about 63% reduction in the price of cassava tubers; 35% for gari and 48% in cassava flour. Oyo reported 69% decrease in cassava tuber price, and 30% decrease in the price of cassava flour, while Ebonyi had about 36% decrease in gari prices. Sharp increases in the prices of yam tubers, flour and sweet potato were recorded in the NW, NC and SW.

A sharp increase in the price of melon was reported. The increases were 35% in Bauchi 70% in Nasarawa 89% and 81% in Osun and Ebonyi states respectively. Price increases for potatoes were more than 94% and 45% in Bauchi and Imo states respectively. Also price of soybean this year increased by more than 80% over that of 2010 in Kano, Oyo, Zamfara and Kaduna States

With regard to animal products, a slight increase in the prices of beef and goat meat was reported in the NE and NW, with Bauchi (16%), Adamawa (18%), Sokoto (13%) and Zamfara (17%). But in NC and SE, significant increases in the prices of beef and goat meat were reported with Kwara (78%), Cross Rivers (97%) and Rivers (136%). Bauchi however, reported a 56% reduction in the prices of chickens. Marginal increases in the prices of eggs were reported in Bauchi (32%), Kaduna (28%) and Benue (26%). Taraba and Cross River reported an increase of 42% and 425% respectively in fresh fish prices. Very high increases were experienced in the prices of both smoked and dried fish with Rivers (433%), Cross Rivers (261%) and Bauchi (76%).

The area devoted to production of maize increased slightly from 5.06 million hectares in 2010 to 5.153million in 2011. The land area under yam and cowpea cultivation remained substantially unchanged at 4.26 million hectares, 3.2million hectares respectively. That of sorghum decreased slightly from 5.04million hectares to 4.89million hectare. Rice area increased from 2.55million hectares to 4.57 million hectare during the same period. Production area for millet and soybean however decreased slightly. Also cotton area decreased again this year for the sixth time in a row.

The output forecast this year for maize is 9.18 million tons compared with 9.0million tons produced in 2010 which represent a 4% increase. Sorghum production will declined slightly from 7.02 to 6.89 million tons. About 4.56million tons of rice is the forecast this year which is comparable with that of last year

Millet production is estimated to decrease from 1.38 million tons to 1.27 million tons this year. The record 52.3 million tons of cassava produced in 2010 will be raised slightly to 52.4 million tons this year.

Soybean output is anticipated to decrease slightly from 599,559 tons produced in 2010 to 564,760 tons expected in 2011. Groundnut production will increase marginally from 2.952 million tons produced in 2010 to 2.963 million ton in 2011. Cotton output will however decreased from 73,097 tons in 2011.

On overall, the food situation prospect for 2011 is only slightly better than that of 2010 despite favourable rainfall situation that prevailed in 2011. Several factors accounts for the poor growth in output figures expected in 2011 among which are poor extension services, low use of improved inputs such as seeds, poor access to credits, high cost of inputs, pests and disease attacks and incidence of floods and dry spells that occurred at different parts of the country.

The purpose of national grain reserve is to ensure an all year round availability of food and food commodity price control. However, majority of the states in the country did not have any record of stored grains and distribution for 2011 and the private sector are yet to key into the effort.

In the 2011 cropping season, incidences of crop pests and diseases were generally light or moderate in severity across the country. In a few cases however, heavy infestations occurred. For instance quela bird attacks on rice and cereals were heavy in Gombe, Ogun, Ondo, Edo and Anambra states; stem borer and striga attacks remained severe on millet, sorghum and maize among the cerals and on cowpea and Alectra attack on ground nut occurred in NE, NC, and SE/SS. Also, blast attack on rice was heavy across the country especially South East and South South zones. Thrips attack on cowpea was heavy in Ekiti and Kano. Also leaf spot infestation on groundnut was heavy in Adamawa and Nassarawa State while mealy bug on yam was reported heavy in Plateau. Dieback infestation on cocoa yam was heavy in the South East and South South zones and light in North West zone. Tomato wilt was especially heavy in Oyo state just as termites attack on yam and early maturing maize. Owing to delay in the cessation of rainfall, concerns for aflatoxin in many of the early maturing grain crops has arisen and may warrant implementation of elaborate control measure of which farmers are yet to learn.

As in the previous years, unavailability of data still plagues the livestock and fisheries sub-sectors in Nigeria. Only twelve states provided scanty data on livestock population and fish production. In many states, production estimates for cattle, sheep, goats and poultry were not very impressive. Large populations of poultry were estimated in Abia, Ekiti, Niger and Kano. Rivers State reported the highest estimates of pig (3.6 million). In cattle production, the following diseases were reported: CBPP in Bauchi and Jigawa; FMD in Bauchi, Bayelsa, Jigawa, Kano, and Rivers states; and feed poisoning in Bayelsa, Jigawa and Kano states. Other reported disease conditions for cattle were diarrhea, kata, mange, helminthiasis and ectoparasites. The coverage of diseases that affected cattle was state wide in the affected states. Many of the stocks were vaccinated against

the prevalent diseases. There were reported cases of PPR, worm infestation, pneumonia, diarrhoea, helminthiasis and chronic respiratory diseases in Kebbi, Kaduna, Niger, Kogi and Ondo respectively. It is noteworthy that Kano, Kogi, Bayelsa and Rivers states treated and vaccinated a high number of sheep and goats. Most of the farmers are practising both intensive and free range local fowls, and a few exotic birds were reared mainly by large-scale commercial farms in most of the states.

High costs of feed and medication were major constraints to farmers in the livestock industry in the country. However, a good number of birds in all the states were vaccinated to enhance production. Data for aquaculture and fisheries were largely not available in many states and even those available were scanty. Out of the 36 states and FCT, only Osun procured and distributed fisheries input, such as fishing nets, fingerlings and feeds in 2011. Many states did not procure inputs due to lack of fund in 2011. In aquaculture, major diseases experienced include bacterial, fungal, viral diseases and broken skull. Fish parasites, such as leeches, helminthes, and predators, such as dragon flies, monitor lizards, snakes and frogs were reported in Ekiti, Gombe, Bayelsa and Edo states, although, their effect was light, except in Bauchi State where heavy infestation was reported. Pest and diseases persist in most states; this is a major challenge to fish farmers, who also lack knowledge and manpower in disease diagnosis and treatment. Poor feeding, insufficient water supply and poor management of fish stock are other challenges faced by farmers.

Across the states, the number of VEAs and other front-line extension agents did not improve. Extension to farmers' ratios remained at record levels that are higher than 1:1800 famers. In Bauchi, Kano, Yobe and Ebonyi states which had the highest number of VEAs of 306, 780, 265 and 257 respectively. The number of VEAs in Ebonyi state was an increase of 65% over the 2010 record. The dwindling funding of ADPs across the country might have been responsible for non-employment of additional VEAs. Anambra, Enugu and Rivers states have the highest EA : farmer ratio, with 1:9,407, 1:6,848 and 1:6,749, respectively. With respect to farm visits, Taraba State ADP recorded the highest number of visits to farmers by VEAs (150,000); while Zamfara State had the lowest record of visits of 56. The use of Management Training Plot (MTP) and On-Farm Adaptive Research (OFAR) slightly increased in a few ADPs. About 62% of the ADPs did not conduct Small Plot Adoption Technique (SPAT) for the year under review. Ekiti State conducted the highest number of SPATs (1,278), while Adamawa State had the highest number of MTPs (10,000) and Imo State, the highest number of OFAR trials (900) which it conducted under the AFDB-CBARBD Project. Kwara, Delta and Ekiti states mounted innovative OFAR and SPAT on fisheries using traditional earthen ponds.

The conduct of forth nightly training (FNT) was not a popular activity among many ADPs. For instance, about 40.5% of the states did not record any FNT for 2011. The modification of FNT to MT did not help matters. In Edo, Imo states and FCT however, almost 100% achievement of FNT targets was recorded. Similarly, only Lagos State and the FCT reported 100% achievement of MTRM targets. Many ADPS have abandoned the conduct of MTRMs owing to funding constraints.

Many states reported delay or lack of payment of counterpart fund for Key development Projects, and also complained of inadequate skilled extension personnel, lack of mobility for fieldwork, as well as the lack of incentives/motivation for extension staff.

In 2011/2012, the major training needs of the ADPs include skill improvement in areas of crop improvement, pests and disease management; agricultural project planning and monitoring; building agricultural extension communication skills of extension specialists; management of tractor operations, fish culture handling, nutrition and breeding; and agricultural produce' storage, processing and preservation and strategy for promoting public compliance to agricultural policy.

Recommendations

The following recommendations are made based on data collected, interactions with stakeholders in agriculture and observations during the field trips:

1. Traditional farm tools remained dominant in Agriculture in Nigeria and a dis-incentive for the engagement of youths. Though government had made some modest investments in the provision of tractors, lack of processing machines is constraining optimal use of the tractors and expansion of production.

In order to stimulate youth participation in agriculture and productive use of available tractors, significant investment in processing machines and cottage level processing skill development is required.

2. Inventory of agricultural machineries in Nigeria is currently lacking which makes planning for mechanization difficult.

A nationwide survey should be commissioned to document the actual needs and available tractors and machines for processing in order to guide the transformation agenda of the country.

3. Climate change is complicating the pressure on the national research system to provide novel technologies for transformation of the nations agriculture but they are beseeched by myriad of infrastructural and funding/ personnel problems.

Improved funding for research to develop appropriate technologies for mitigating the effects of climate change, multi-purpose tree species for checking soil erosion, desertification, nutrient efficient crops, control of pests and diseases of crops, livestock and fisheries and low cost feeds and feeding techniques for fisheries and livestock.

4. Sustainable agricultural transformation requires active engagement of skilled extension personnel. Presently, the number of such personnel available is uncertain. Also, the number of unemployed graduates that could be mobilized to realize the transformational agenda is yet to be determined.

A national census of extension personnel and unemployed graduates should be conducted with a view to factoring their integration into agricultural value chain incubation schemes upon which the transformation agenda would be leveraged.

5. The strategic grain reserve of the federal government is currently not being complimented at the state levels.

To enhance effectiveness of the programme state governments and the private sector need to take a more active responsibility in ownership, stocking and distribution. A situation in which the operation of the strategic grain reserve scheme is almost under the exclusive control of the Federal Government is unlikely to be sustainable.

6. There is paucity of data on livestock and fisheries production across the states. There is therefore the need to initiate the conduct of livestock population census and nationwide fisheries production survey in order to enhance the reliability of livestock and fisheries data for development planning.
7. Increasing production cost coupled with low producer prices is making agriculture unattractive. Provision of growth support incentives need to be enhanced and sustained using schemes that benefit the target farmers such as the improved voucher scheme.
8. Across the country, extension service institutions are weak and showing signals that they cannot anchor anticipated transformation agenda of government unless there are reforms. Central to the problem of extension service is the structure of its funding and administration. At a national level, extension services do not have a coordinating or supervisory supports that trickle down to all levels of governance such that there are fairly good measures of congruence towards the national food security goal. This has occasioned an extension system in disarray. In many states, provision for counterpart funding is overarching or the only provision for agriculture. Uncoordinated intervention of projects by donor agencies in many states depletes extension personnel and the capacity of the ADPs to institutionalize statewide agricultural development. The problem is complicated by poor involvement of the Local Government Area councils in agricultural extension service.

There is an urgent need for the establishment of a Department of Agricultural Extension at the Federal Ministry of Agriculture and Rural Development to coordinate and promote active involvement of all tiers of government in agricultural extension services.
